Report To The Consumer
On Water Quality

January 1, 2010 – December 31, 2010

Este informe contiene información muy importante sobre la calidad de su agua beber. Tradúscalo ó hable con alguien que lo entienda bien.

Díí kwe'é naaltsoos hasht'eelyaayíí 'éí nit haz'ánígi tó baa 'áháyáá dóó yá'át'ééh óolzinígíí yaa halne'. Doo bik'i'dinitijhgóó da, t'áá háïda ta' níká’doolwot dóó hazhó'ó yee nit ch'ihodoo'áát.

Inner Basin water line damaged by Schultz Fire & Floods of 2010
The mission of the Utilities Department is to professionally and cost effectively provide water and wastewater services that meet the present and future environmental, health and safety needs of the community and our co-workers.

We are committed to a goal of 100% customer satisfaction. We achieve this by a dedication to exceed customer expectations and continuously improving our product. We appreciate the dedication our staff takes in their work and motivate our co-workers by providing an environment that encourages improvement and teamwork.

Water Quality is always of paramount importance and I am pleased to present you the 2010 City of Flagstaff Report to the Consumer on Water Quality.

This annual report outlines where your drinking water comes from, how it is treated and the results of tests performed on the quality of Flagstaff’s drinking water.

Additionally, as mandated by the U.S. Environmental Protection Agency, this report informs you of contaminant levels in your drinking water, as well as violations incurred last year, among other important health information.

Thank you.

Randy Pellatz
Director, Utilities Department
IS MY WATER SAFE?

During 2010, 1176 water samples were taken and analyzed to meet our goal of providing quality water to our customers and to ensure compliance with all the standards required by the Safe Drinking Water Act. Last year, as in years past, your tap water met all U.S. Environmental Protection Agency (EPA) and state drinking water health standards. Local Water vigilantly safeguards its water supplies and once again we are proud to report that our system has not violated a maximum contaminant level or any other water quality standard.

DO I NEED TO TAKE SPECIAL PRECAUTIONS?

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers.

EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Water Drinking Hotline (800-426-4791).

WHERE DOES MY WATER COME FROM?

In 2010 the Utilities Department distributed approximately 2722 million gallons of water an average of 7.48 million gallons per day. Total water production was down 0.5 % over last year.

The City of Flagstaff is supplied by surface water from Upper Lake Mary and the Inner Basin of the San Francisco Peaks. We also pump groundwater from the Woody Mountain Wellfield, Lake Mary Wellfield, and other Local Wells, which tap the Coconino and Supai Aquifers. These sources blend in the water distribution system and the amount of water coming from each source varies throughout the year.

SOURCE WATER ASSESSMENT AND its AVAILABILITY

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Based on a mandate set forth in the 1996 amendments to the Safe Drinking Water Act, ADEQ evaluated each water source used by public water systems in Arizona. These evaluations assessed the hydrogeology of drinking water sources to determine the quality of groundwater being drawn into wells, evaluated the watersheds supplying surface water, and surveyed land use activities occurring near drinking water sources.
This information is now used to determine the degree to which a public drinking water source is protected from, or at risk of, contamination. It is also used to assist local communities in implementing source water protection measures.

Adjacent land uses within a specified proximity to a drinking water source, or the designated source water assessment area, can now be evaluated by ADEQ to determine if they are in fact posing a contamination risk. ADEQ has compliance information (occurrence data) on all public water systems in Arizona as well as many of the land uses found within drinking water source water assessment areas.

Because of this customized approach in studying each individual system, the source water assessment reports allow for better protection of drinking water and allow ADEQ to tailor monitoring requirements specific to each system where appropriate.

For example, if a water system has no history of contamination by a particular chemical, as well as no potential for future contamination (based on land use practices and the risk they might pose to water sources), then monitoring relief or reduced monitoring for that chemical may be granted for that system. Another water system with a history of problems or the potential for contamination with the same chemical would still be required to monitor for that substance.

ADEQ is confident that these assessments and the related source water protection activities are instrumental in preserving drinking water safety.

Arizona's Source Water Assessment Plan

WHY ARE THERE CONTAMINANTS IN MY DRINKING WATER?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline (800-426-4791).

Contaminants That May Be Present In Source Water

In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Microbial Contaminants: Viruses, bacteria, and protozoa, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife. Microbial contaminants can cause short-term effects such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a special health risk for infants, young children, and people with compromised immune systems.
**Inorganic Contaminants:** Salts and metals, which can be naturally occurring or result from urban storm runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming. Certain inorganic contaminants consumed at levels in excess of the maximum contaminate level (MCL) may result in skin damage, circulatory problems, liver problems, kidney damage, and increased risk of cancer.

**Pesticides and Herbicides:** This may come from a variety of sources such as agriculture, storm-water runoff, and residential uses. Pesticides and herbicides consumed at levels greater than the required MCL may result in increased risk of blood problems, reproductive difficulties, kidney and liver damage, and increased risk of cancer.

**Synthetic and Volatile Organic Chemical Contaminants:** Which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm-water runoff and septic systems. Synthetic and volatile organic contaminants consumed at levels greater than the required MCL may result in increased risk of blood problems, reproductive difficulties, kidney and liver damage, and increased risk of cancer.

**Radioactive Contaminants:** Which can be naturally occurring or be the result of oil and gas production and mining activities. Radioactive contaminants may result in an increased risk of getting cancer.

**DRINKING WATER REGULATIONS**

**Haloacetic Acids:** Haloacetic acids (HAA5) are disinfection by-products that are formed when chlorine is used as the disinfectant. These compounds can increase the risk of cancer, and became regulated as of January 1, 2002 with a MCL of 60 ppb.

**Total Trihalomethanes:** Total Trihalomethanes (TTHMs) are disinfection by-products that are formed when chlorine is used as the disinfectant. These compounds can increase the risk of cancer, and became regulated as of January 1, 2002 with a MCL of 80 ppb.

**Chlorite:** Chlorite is a byproduct of chlorine dioxide disinfection. The MCL for chlorite in the distribution system is 1.0 ppm. Potential health effects that may be attributed to exceeding the MCL for chlorite include anemia and nervous system effects in infants, young children and the fetuses of pregnant women.

**Maximum Residual Disinfection Level (MRDL):** Regulations for the Maximum Residual Disinfection Level (MRDL) set a maximum limit for the running annual average MRDL at 4.0 ppm for chlorine. Chlorine dioxide is a disinfection used in the treatment of surface water. The MRDL for chlorine dioxide leaving the treatment plant is 800 ppb. Potential health effects that may be attributed to exceeding the MRDL for chlorine dioxide include anemia and nervous system effects in infants, young children and the fetuses of pregnant women.

**TOC Removal Requirements:** Control of disinfection by-product precursors has brought new regulations governing TOC removal requirements. TOC removal is accomplished through enhanced coagulation or enhanced softening. Regulations require a 50% TOC removal when the raw water TOC concentration is >8mg/L and alkalinity is
<60mg/L. Violations occur when the ratio of the amount of actual TOC removal divided by the required amount of TOC removal is <1 when taken as a running annual average.

**Long Term 2 Enhanced Surface Water Treatment Rule:** Implemented in 2006 is designed to reduce the disease incidence associated with Cryptosporidium and other pathogenic organisms by building on existing rules.

**ADDITIONAL INFORMATION FOR ARSENIC**

While your drinking water meets EPA’s standard for arsenic, it does contain low levels of arsenic. EPA’s standard balances the current understanding of arsenic’s possible health effects against the costs of removing arsenic from drinking water. EPA continues to research the health effects of low levels of arsenic which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

**MONITORING AND REPORTING OF COMPLIANCE DATA VIOLATIONS**

ADEQ and the Flagstaff Municipal Water System work together to ensure that your drinking water meets all the monitoring requirements mandated by the Safe Drinking Water Act (SDWA). There were no monitoring or compliance violations reported in 2010.

**HOW CAN I GET INVOLVED?**

It is the obligation of the Utilities Department to provide a safe and adequate supply of drinking water. To help please our customers and meet our obligation, the Utilities Department strongly encourages public input and community participation on decisions affecting your water resources.

Regular Flagstaff Water Commission meetings are held the third Thursday of each month. Meeting locations are posted on the official City bulletin board at City Hall.

Meetings begin at 4:00 PM and you are always welcome.

Copies of this report are available at the Utilities Administration Office, City Hall, 211 West Aspen Avenue, Flagstaff, Arizona 86001

Or on our web site at:

www.flagstaff.az.gov

This report provides you with valuable information about Your drinking water that is easy to understand.

We hope the results found in this report confirm that you can count On the City of Flagstaff for quality at the tap.
WHAT DOES THE WATER QUALITY TABLE MEAN?

The Water Quality Table lists all of the drinking water contaminants that we detected during the calendar year of this report. The presence of contaminants in the water does not necessarily indicate that the water poses a health risk.

Unless otherwise noted, the data presented in this table is from testing done in the calendar year of the report. The EPA or the State requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently.

Thank you for reading this important information on your water’s quality
We’ll be happy to answer your questions about the City of Flagstaff’s Water Supply

### Microbiological Contaminants

A violation occurs when a routine sample and a repeat sample, in any given month, are total coliform positive, and one is also fecal coliform or E. coli positive.

- **Total Coliform (% positive samples/month)**: 0 / 5 / 0 / 0 / 2010 No Naturally present in the environment
- **Turbidity (NTU)**: 100% of the samples were below the TT value of 0.3. A value less than 95% constitutes a TT violation. 2010 No Soil runoff

The highest single measurement was 0.3. Any measurement in excess of 1 is a violation unless otherwise approved by the state.

### Radioactive Contaminants
